

Math 323 Section 9.1 Problems

1. The height of hobbits is normally distributed, with mean θ and standard deviation v , both unknown constants.

Ten randomly selected hobbits have heights of 51, 47, 48, 48, 43, 50, 42, 49, 45 and 46 inches.

- (a) Calculate $\hat{\theta}$ and \hat{S}_n^2 .
- (b) Give a 95% confidence interval for the average height of hobbits.
- (c) Suppose we only want an upper bound for the average height. Find a $\hat{\Theta}_n^+$ so that

$$P(\theta \leq \hat{\Theta}_n^+) = 0.95$$

using the t -distribution.

2. The costs of repairing minivan bumpers damaged by a 5-mph collision, for seven models of minivan, are given by 1154, 1106, 1560, 1769, 2299, 1741 and 3179 (dollars). Assume that repair costs are normally distributed.

- (a) Calculate $\hat{\theta}$ and \hat{S}_n^2 .
- (b) Find a 95% confidence interval for the true average repair cost.

3. Suppose we sample independent Bernoulli random variables with unknown success probability θ . In n trials we find k successes.

- (a) What is $\hat{\theta}$?
- (b) Using the normal approximation, what is the variance of $\hat{\theta}$?
- (c) Compute \hat{S}_n^2 for k successes in n trials.

Critical values of t

df	$t_{0.100}$	$t_{0.050}$	$t_{0.025}$	$t_{0.010}$	$t_{0.005}$
1	3.078	6.314	12.71	31.82	63.66
