

1. An exponential random variable with mean θ has probability density function given by

$$f(x) = \begin{cases} \frac{1}{\theta}e^{-x/\theta} & x > 0 \\ 0 & \text{elsewhere.} \end{cases}$$

Let X be an exponential random variable with parameter $\theta = 2.4$.

- (a) What is the probability that X is larger than 3.3?

- (b) Given that X is bigger than 2.7, what is the probability that X is also bigger than 5.2?

- (c) Compute $\mathbb{E}(100 + 7X^2)$

2. A pair of random variables (X, Y) has joint probability density function

$$f(x, y) = \frac{3}{5}(x^2 + xy), \quad 0 \leq x \leq 1, 0 \leq y \leq 2$$

(a) Find the probability that the sum of X and Y is at least 1.

(b) Find the expected value of X .

(c) Find the expected value of the product of X and Y .

3. A door-to-door salesman has found that 94% of households will buy no merchandise, 5% will buy \$10 worth of merchandise, and 1% will buy \$1000 worth of merchandise. Suppose that the salesman visits 20 houses.

(a) What is the appropriate distribution for this problem? Describe all relevant parameters.

(b) Find the expectation of the salesman's sales (in \$).

(c) Find the variance of the salesman's sales (in \$).

4. We can accurately model the height of Romulans as a normal population with mean $\mu = 169$ cm. and standard deviation $\sigma = 9$ cm.

(a) How tall are the tallest 5% of Romulans?

(b) Captain James T. Kirk is 173 cm. tall. What proportion of Romulans are taller than Captain Kirk?

(c) Spock is 184 cm. tall. What proportion of Romulans are taller than Captain Kirk but shorter than Spock?
