MATH 472 COMPUTING PROJECT # 2

April 4, 2019, Due April 11, 2019

The object of this project is to implement and study the convergence rates of three iterative methods: Jacobi, Gauss-Seidel and SOR. These methods will be applied to the system $A\mathbf{x} = \mathbf{b}$ where A is the $n \times n$ tridiagonal matrix $A = \begin{bmatrix} -1 & 2 & -1 \end{bmatrix}$ and we want to apply these methods to different system sizes n = 25, 50, 100, 200.

For a given n, let $h = \frac{1}{n+1}$. The vector **b** is given by

$$b_i = 2h^2, \ i = 1, \dots, n,$$

and the solution \mathbf{x} is given by

$$x_i = ih(1 - ih), \ i = 1, \dots, n_i$$

Implement each of the three methods paying special attention **not the store the matrix in general form and to avoid multiplication by zeros**. In other words you need to exploit the sparsity of the matrix.

For the SOR method use the following values for the relaxation parameter ω :

n	25	50	100	200
ω	1.78486	1.88402	1.93968	1.96922

For each of the 12 tasks

- (1) Start the iteration with $\mathbf{x}^{(0)} = \mathbf{0}$.
- (2) Stop the iteration when $\|\mathbf{x}^{(\mathbf{k})} \mathbf{x}\|_{\infty} < 10^{-6}$. Print the number k of iterations.
- (3) Calculate and print the experimental estimation of $\rho(T)$ using the formula

$$\rho(T) \approx \exp\left(\frac{1}{k} \log\left(\|\mathbf{x}^{(\mathbf{k})} - \mathbf{x}\|_{\infty} / \|\mathbf{x}^{(\mathbf{0})} - \mathbf{x}\|_{\infty}\right)\right).$$

Organize your output as
